BAUSCH Health

Bausch Health, Canada Inc. and the pan-Canadian Pharmaceutical Alliance sign letter of intent for public drug plan coverage of PrOKEDI® (Risperidone for extended-release injectable suspension) for the treatment of schizophrenia

June 09, 2026

LAVAL, QC, June 9, 2026 - Bausch Health, Canada Inc., part of Bausch Health Companies Inc. (NYSE: BHC)(TSX: BHC), today announced that it has successfully completed negotiations with the pan-Canadian Pharmaceutical Alliance (pCPA), resulting in a Letter of Intent (LOI) for PrOKEDI® (Risperidone extended-release injectable suspension) 75mg and 100mg, a long-acting injectable antipsychotic agent for the treatment of schizophrenia in adults.[1]

The issuance of this LOI marks a key milestone toward securing public coverage and enabling patient access to PrOKEDI® across Canada. Bausch Health remains committed to working closely with federal, provincial, and territorial public drug plans, to finalize Product Listing Agreements and support timely and equitable access for Canadians living with schizophrenia.

PrOKEDI® is designed to provide rapid attainment of clinically relevant risperidone plasma concentrations, followed by sustained release over the 4-week dosing interval, without the need for oral supplementation or a loading dose.[1]

"We are very pleased to have reached agreement with the pan-Canadian Pharmaceutical Alliance on terms that will help expand access to PrOKEDI® for people living with schizophrenia through public drug plans," said **Amy Cairns, General Manager, Bausch Health, Canada Inc.** "This milestone brings us closer to supporting patients, their families, and caregivers with new treatment options, and we look forward to quickly finalizing agreements so Canadians can benefit as soon as possible."

"We welcome the Letter of Intent between Bausch Health, Canada Inc. and pCPA, which will advance access to PrOKEDI® and providing people living with schizophrenia with an important new treatment option." **Dr. Howard Margolese, MD, CM, MSc, FRCPC, President of Early Psychosis Intervention Canada**

"It is very encouraging to see progress toward improved access to medications for Canadians living with schizophrenia," said **Dave Gallson, National Executive Director of Mood Disorders Society of Canada**. "Schizophrenia is a life changing illness that can profoundly affect daily functioning, independence, and quality of life, making timely access to additional treatment options critical to helping people living with schizophrenia lead more stable, fulfilling lives."

About Schizophrenia
Schizophrenia is a chronic and severe psychiatric disorder that typically emerges in late adolescence or early adulthood and affects about 1% of the population. The illness is characterized by episodes of psychosis and loss of contact with reality, as well as emotional and

cognitive symptoms. It affects how a person thinks, feels, behaves, and relates to others, often impairing functioning, relationships, employment and quality of life.[2]

Relapses are common throughout the illness, with over 80% of patients experiencing relapse within five years of a first episode of schizophrenia.[3] Relapse is associated with progressive brain loss, worsening symptoms, hospitalization, functional decline and increasing treatment resistance, highlighting the importance of early intervention, sustained symptom control and continuity of care. Although there is no cure for schizophrenia, the illness can be effectively managed through a combination of antipsychotic medication, psychosocial support, and community-based care, enabling many people to achieve stability, recovery, and meaningful participation in daily life.[2]

Long-acting injectable antipsychotics may play an important role in supporting treatment continuity and reducing the risk of relapses in patients living with schizophrenia.

OKEDI Clinical Data and Safety Information

The pivotal PRISMA-3 randomized, double-blind, placebo-controlled study in adults with acute exacerbation of schizophrenia (N=438) demonstrated that once-monthly PrOKEDI® (75 mg and 100 mg) significantly improved symptoms versus placebo over 12 weeks. Treatment resulted in greater reductions in PANSS total scores and CGI-S scores, with differences versus placebo reaching statistical significance ($p<0.0001$). Improvements were also observed across symptom domains. In the published study, higher response rates were observed with PrOKEDI® compared to placebo. The safety profile was consistent with known risperidone effects, including prolactin-related events, headache, and weight gain.[4]

In the 12-month open-label extension study (PRISMA-3 OLE; N=215), continued treatment with PrOKEDI® was associated with sustained symptom improvement and disease stability. The long-term safety profile was consistent with that observed in the pivotal trial, with no new safety signals identified.[5]

For patients who have never taken risperidone, tolerability with oral risperidone prior to initiating treatment with PrOKEDI® should be established. Health Canada has not authorized the use of PrOKEDI® in pediatric patients (<18 years).[1]

About Bausch Health

Bausch Health Companies Inc. (NYSE: BHC)(TSX: BHC) is a global, diversified pharmaceutical company enriching lives through our relentless drive to deliver better health outcomes. We develop, manufacture and market a range of products primarily in gastroenterology, hepatology, neuroscience, dermatology, dentistry, aesthetics, international pharmaceuticals and eye health, through our controlling interest in Bausch + Lomb Corporation. Our ambition is to be a globally integrated healthcare company, trusted and valued by patients, HCPs, employees and investors. For more information, visit
