

Bausch + Lomb Initiates Clinical Trial Evaluating New Cohesive Ophthalmic Viscosurgical Device (OVD) For Use In Cataract Surgery

December 17, 2019

Investigational OVD Now the Second in the Company's Pipeline

BRIDGEWATER, N.J., Dec. 17, 2019 /PRNewswire/ -- Bausch + Lomb, a leading global eye health business of Bausch Health Companies Inc. (NYSE/TXS: BHC), announced today that it has initiated a clinical trial evaluating the safety and efficacy of a new cohesive ophthalmic viscosurgical device (OVD) intended to provide cataract surgeons with a new option in the continuum of cohesive and dispersive viscoelastics, which are used to create and maintain space in the anterior segment of the eye during cataract surgery.

"OVDs are an essential part of modern cataract surgery, which is one of the most frequently performed surgical procedures in the world,"¹ said Joseph Gordon, U.S. president, Bausch + Lomb. "This new OVD candidate, the second currently under development by Bausch + Lomb, is yet another example of how we apply deep expertise to identify and fill gaps in the marketplace, as well as to anticipate surgeons' future needs. It's also indicative of our company's heritage and ongoing commitment to helping eye care professionals deliver on our shared commitment to helping people see better to live better."

About OVDs

OVDs aid in cataract extraction and intraocular lens (IOL) implantation by creating and maintaining space, aiding in tissue manipulation, enhancing visualization and protecting the corneal endothelium and other intraocular tissues. OVDs may also be used to coat IOLs and instruments during cataract surgery.

About Cataracts and Cataract Surgery

A clouding of the normally clear lens of the eye most commonly caused by aging,² cataracts are a leading cause of vision loss in the U.S. and the leading cause of blindness worldwide.⁴ More than 20 million Americans aged 40 years and older have cataract in one or both eyes, and that number is expected to increase to more than 30 million by 2020.³ Cataract surgery is when a cloudy lens is removed and replaced with a clear, artificial lens called an IOL.⁴ According to the U.S. National Eye Institute, cataract surgery is one of the safest, most common and effective surgical procedures performed in the United States.⁵ In most cases, people experience improved vision after the procedure.⁵

About Bausch + Lomb
